Application

The In-situ Laser Analyzer ILA1-B000-EX is a high-performance sulfur dioxide analyzer for industrial and process control applications.

Industries that can benefit from this measurement technology are chemical and petrochemical plants, power plants, waste incinerators and the steel industry.

Description

The In-situ Laser Analyzer ILA1-B000-EX consists of a probe with a measuring section, probe flange and sensor head with a separate HMI unit. The transmitter and receiver are located in the sensor head while the beam reflector is placed inside the tip of the probe lance in the measuring section. The active measuring path is the result of the laser installed in the sensor head emitting an infrared laser beam that passes through the process gas to the retroreflector and from there is reflected back to the receiver in the sensor head.

The analyzer is particularly suitable for controlling combustion processes, process optimization and control, ensuring facility and workplace safety, explosion protection, quality control and measurement in corrosive and toxic gases.

An integrated system for continuous N₂ or instrument air purge prevents dust and other contaminants from coating the retroreflector and sensor head window.

The external HMI or a PC with access to the web interface can be used to operate, configure and perform diagnostics on the ILA1-B000-EX.

Application examples include process monitoring at sulphur recovery plants, combustion optimization and control in cement plants and in sulphuric acid production as well as monitoring SO₂ scrubbers at stationary combustion plants and on ships.
